

Manage Kid

Manage Kid is a mobile application which came into existence from an idea emerging from the requirement of cybersecurity for kids who are exposed to the internet.

Challenges

The internet poses risks to children and teenagers in many forms. Limited usage is required for their protection, and our innovative customer wanted to solve the problem. Our application developers brainstormed the idea but found the concept had:

1. No proper infrastructure
2. The designing of the architecture and implementation was needed.
3. Parental control from one device to another device was required.

Solution

The need for a proper plan was required, and the steps were made clear to start working on the basic idea to bring it to work on ground bases.

- ★ The development of the two models was necessary - one for the parent device and another for the child.
- ★ The modes were made to limit the device functionality.
- ★ The child app is made with the feature of removing the uninstalling functionality, unlike other apps.
- ★ The parent version was made functional for remote access to modes of the child's device according to their requirement and timings.

When it comes to the controlling of one device from another device it required compatible features supported by all devices to be created:

1. Backend as a Service is provided to ensure the functionality.
2. We implemented the jQuery framework with full customizable excellence.
3. Child version is made non-editable
4. Parent version is made to set up the limits of the child device

Result

1. The emergence of the risk-free environment.
2. Satisfied customers.
3. The working as an accomplishment of Techstern.
